

System Execution Guide: DHL Knowledge-Based RPA Bot

Prerequisites

Before running the system, please ensure the following software is installed on your machine:

- **Node.js & npm** (for running the Vue frontend and JSON Server)
- **UiPath Studio** (for executing the RPA bot)
- **Google Chrome or Microsoft Edge** (for the web interface)

Step 1: Initialize the Mock Database (Backend)

The application relies on json-server to mock REST API interactions.

1. Open a terminal (Command Prompt or VS Code Terminal).
2. Navigate to the root directory of the web application: `cd [Your_Path]\DHL_CHALLENGE_FORCED`
3. Start the JSON Server on port 3000 by running the following command: `npx json-server --watch backend/db.json --port 3000`
4. Leave this terminal window open and running.

Step 2: Initialize the Vue Application (Frontend)

1. Open a **second, new terminal window**.
2. Navigate to the frontend directory: `cd [Your_Path]\DHL_CHALLENGE_FORCED\frontend`
3. Install the required Node dependencies (if not already installed): `npm install`
4. Start the Vue development server: `npm run serve`
5. Once compiled successfully, open your web browser and navigate to: `http://localhost:8080/upload`

Step 3: Configure the Test Data

The RPA bot is designed to read raw text files and automatically input them into the Vue application.

1. Locate the `Raw_DHL_input` folder provided in the submission zip. This folder contains sample .txt damage reports.
2. Note the absolute file path of this folder on your local machine.

Step 4: Execute the UiPath RPA Bot

1. Open **UiPath Studio**.
2. Click **Open** and select the project.json file inside the provided UiPath project folder.
3. Open the Main.xaml workflow file.
4. Locate the "**For Each File in Folder**" activity near the top of the workflow.
5. Update the "Folder" property path to match the exact location of the Raw_DHL_input folder on your local machine.
6. Ensure your web browser is open to <http://localhost:8080/upload> and is visible on your screen.
7. In UiPath Studio, click the arrow below the "Run" button and select **Run File**.
8. **Do not use the mouse or keyboard.** The bot will take over to iterate through the text files, attach them, populate the Vue application, submit the data to the JSON database, and display a final execution report.
